DNS for Measurement Rendez-vous

DNS as Rendez-Vous

- Problem: Measurements with large target list are hard to do in RIPE Atlas
- Solution: Use DNS to distribute the target list
- Hack: Custom DNS server
 - <https://github.com/emileaben/scapy-dns-ninja>
 - <https://github.com/USC-NSL/RIPE2015HackAThon>
- <https://labs.ripe.net/Members/emileaben/measuring-more-internet-with-ripe-atlas>

How Does It Work?

- Measurement in RIPE Atlas
 - hostname: ip-list.emileaben.com
 - resolve on probe
- Custom DNS server
 - recognises the hostname
 - returns the next IP on the list
- Test list:
 - .1 in all routed prefixes (iPlane-like)

Results

Metrics for ninja-measurements on 2015-01-01

(0.51% of all RIPE Atlas traceroutes that day)

Playing Together?

- Can we make measurement infrastructures team-probe together?
 - 20 Ark vantage points + 40 RIPE Atlas probes + AMP + perfSonar + ??
- Can we make collaborative destination lists?
 - near-realtime
 - redirects to other destination lists?
